About

For the past 15 years, I have been generating value in the technology, science, and IT sectors. For the last 12 years, I have been working professionally, always prioritizing integrity and exceptional quality.

I have continuously focused on self-improvement and technical mastery. And now..., I am building and launching my own products.

When I set a goal, I pursue it with relentless determination until it is successfully accomplished.

Birth Date

19 May 1997

Languages

Uniboom - C. T. O.

01 / 2025 - 07 / 2026

As C.T.O. of Uniboom, a high-performance social media platform tailored for university students, I manage the engineering team and oversee all software architecture and DevOps setups from scratch. Beyond core infrastructure, I directed the technical implementation of complex product features, including custom story systems and gamified community engagement mechanics. For the Front-End, we develop in React Native with full TypeScript, utilizing our custom-built UI component library, a proprietary design system, and our new generation 'ncore-context' state management. On the Back-End, our microservices are built with Nest.js, incorporating custom validations, Redis, and RabbitMQ.

I completely designed our highly secure, scalable cloud architecture using AWS (EC2, ECS, S3 for video/image processing, ALB, NAT, Security Groups), along with Lightsail for development and Cloudflare. Throughout this lifecycle, I have established all technical structures, led the team, and actively coded across both the front-end and back-end.

NIBGAT® & NİBGAT® | Community - Founder

06 / 2013 - Now

Global Developers Power. Developers, who come together with the "develop anything anywhere" mentality and growing continuously. A community that produces new development methods for the virtual world using quality and reliable systems. I have ensured the establishment of a community that aims to train Turquoise Beret Developers who have the necessary competence and endeavour to take part on the virtualization and development of the technological infrastructure of the constantly developing and Globalizing world.

While completing the establishment of communities, a software company emerged. I am also the founder of this company, and we are actively developing our own products. Additionally, we are actively contributing to major software projects in the industry.

Pedal Park - Software Development Team Leader

08 / 2025 - 05 / 2026

As the Software Development Team Leader for PedalPark Konya, a smart bicycle rental mobile application developed for the Konya Metropolitan Municipality, I led the engineering team and directed the end-to-end software development lifecycle. I managed the architectural design and implementation of scalable mobile interfaces and secure backend systems critical for real-time bicycle tracking, user management, and seamless rental operations.

By closely coordinating the team's efforts, I ensured a highly reliable and optimized integration between our digital platform and the physical rental infrastructure. Alongside my team management and leadership responsibilities, I remained heavily involved in hands-on development, actively writing code to build a robust, user-centric public mobility solution.

Experiences - 4

İşin Olacak Information Technologies - Head of Technology

08 / 2023 - Now

I'm managing a technical team of 10 people, taking on the role of C.T.O. I oversee the management of Software Architecture and Software Development processes since we're a small team at the moment.

For the Front-End, we develop using React and React Native. We've developed 2 npm packages named 'isinolacak-web-cl' and 'isinolacak-mobile-cl'. We use these 2 libraries internally to build the applications within our company. Both of these libraries serve as Component Libraries and are open-source.

On the Back-End side, we've utilized Nest.js for development. We've opted for RabbitMQ for queuing and Redis for caching. It operates with 14 sub-services. We've developed using AWS technologies such as AmazonMQ, DocumentDB, etc. For the chat feature, we've chosen RethinkDB. MongoDB is employed in all other infrastructure aspects. I've managed all these processes, setups, and the team. I've been actively coding on both the front-end and back-end parts of the project.

Experiences - 5

Meet the Music - Front - End Developer / Consultant

09 / 2022 - 11 / 2023

I've been involved in ensuring the stability of version 1.0, implementing minor features, and establishing and developing the entire infrastructure for version 2.0.

I've worked on nearly every aspect required for a mobile application today, including back-end processes, third-party integrations (such as Spotify, Shazam, etc.), Socket (Centrifugo), social login, location-based operations, package customization, detailed upload processes, global and local storage, state management, detailed network operations, and development in chat areas and many others.

I've also provided numerous ideas and consultancy on the project workflow and front-end aspects. After completing all my tasks, we successfully closed our contract with the completion of our agreement.

Experiences - 6

24 Saatte İş - Front - End Developer

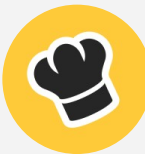

09 / 2022 - 11 / 2023

I joined the team as a React-Native mobile application developer. Over the course of a year, we upgraded the '24 Saatte İş' app to the latest React-Native version.

Afterwards, we completely redeveloped the app from scratch in terms of UI/UX.

In recent months, I made some fixes on the Back-End side developed with Docker-Nest.js, and due to authorization issues encountered in my role as CTO, I resigned and left the company.

Experiences - 7

Tarifolog - C.T.O.

03 / 2022 - 10 / 2023

I developed the technical plan, architecture, and entire infrastructure of the project 'Recipe Social Network.' I named it myself. I outlined the database architecture, service architecture, and front-end plan. I actively participated in the project's codebase. Throughout the project, I held the role of CTO. However, due to disagreements over equity that arose after the project was completed and launched, I decided not to include it in my career.

Recipeolog is a project with a structure where each ingredient is managed separately using traditional and digital units, and ingredients can be saved to the system with a warehouse-stock structure. Afterwards, you can list meals that can be made with ingredients defined in your account based on the ingredients entered into the system. The challenge was to simplify this infrastructure to its simplest form. Additionally, we focused heavily on design in this system, and the project came to us after a year-long dormant development process.

Outsource & Freelance

12 / 2020 - Now

In the Taptoweb A.Ş.: I took part on the migration of a mobile app called Bampos from Native-Script to React-Native at the outsource. I was forced to learn Native-Script and make some improvements. I developed a named Bompos a accounting app.

In the Girişimci Dostu: The company was a start-up. We produced the software of a Token-Coin company called TMN Global. I was start as a React-Native mobile developer however as soon as I started, i found myself developing on Vue + HTML + CSS. My first task was to code the homepage of the product with heavy CSS Animations. Then I made some Vue enhancements and wrote tests on Cypress. I made bug fixes also on back-end side developed with NodeJS. I wrote tests using Mocha + Chai. After releasing the web part, i developed the mobile part with React-Native.

I've been involved in projects like Inkatech, Mindia, IYSL, and many others. As far as I can recall, I've managed and coded for over 150 projects.

Experiences - 9

Akinsoft - Full - Stack Developer

01 / 2019 - 12 / 2020

I was hired as a "React-Native Mobile Application Developer". I worked for the digital transformation of the mobile department for 2 years. I took part in UI/UX design of all mobile apps' migration from Titanium to React-Native. I also took part in all React-Native coding. We have developed a component-library. I developed utility node scripts for all-day tasks.

I developed an internal job tracking & collaboration system called "İş Takip". I used the following tech stack for this system: NodeJS + GraphQL + Subscriptions Transport Ws + RethinkDB + ExpressJS + HTML + CSS + React-Native + Apollo. In short, I developed the entire project from scratch with its API, mobile app and back-end. The company has completed all of its mobile needs. We mutually successfully achieved our goal.

Experiences - 10

Akinsoft - Game Department Setup

07 / 2016 - 11 / 2016

I used Unity3D, Blender3D, PhotoShop and Corel. I developed with C#. Within 6 months, I made a 3D Arcade game by myself. I used Unity3D, Blender3D, PhotoShop and Corel. I developed with C#. Within 6 months, I made a 3D Arcade game by myself, and the company abandoned this work because it thought the idea of game development wouldn't fit with its corporate progress.
